

Françoise Quignard (quignard@enscm.fr), is senior researcher of the CNRS, affected to the Institut Charles Gerhardt Montpellier. The scope of her research group is the elaboration and characterisation of tailored materials with appropriate chemical functions and proper accessibility for application in catalysis, adsorption, separation and healthcare. Her experience in organometallic chemistry and heterogeneous catalysis has allowed her to develop polysaccharide aerogels as materials for catalysis and adsorption. Some significant papers in the field are A.B. Sorokin et al., "Chitosan supported phthalocyanine complexes, Bifunctional catalysts with basic and oxidation active sites", *Appl. Catal. A* 309 (2006) 162; R. Valentin et al., "FTIR spectroscopy of NH₃ on acidic and ionotropic alginate aerogels", *Biomacromolecules*, 7 (2006) 877; "Accessibility of the functional groups of chitosan aerogel probed by FT-IR-monitored deuteration", *Biomacromolecules*, 8 (2007) 3646; M. Robitzer et al., "Nanostructure of calcium alginate aerogels obtained from multistep solvent exchange route", *Langmuir*, 24 (2008) 12547; R. Valentin et al.; F. Liu et al., "Photoluminescent Porous Alginate Hybrid Materials Containing Lanthanide Ions", *Biomacromolecules* 9 (2008) 1945; F. Quignard et al., "Aerogel materials from marine polysaccharides", *New J. Chem.* 32 (2008) 1300.
